

LIWC-22 Validation Report

Custom scorer vs LIWC-22 CLI (Dutch LIWC-2015 dictionary)

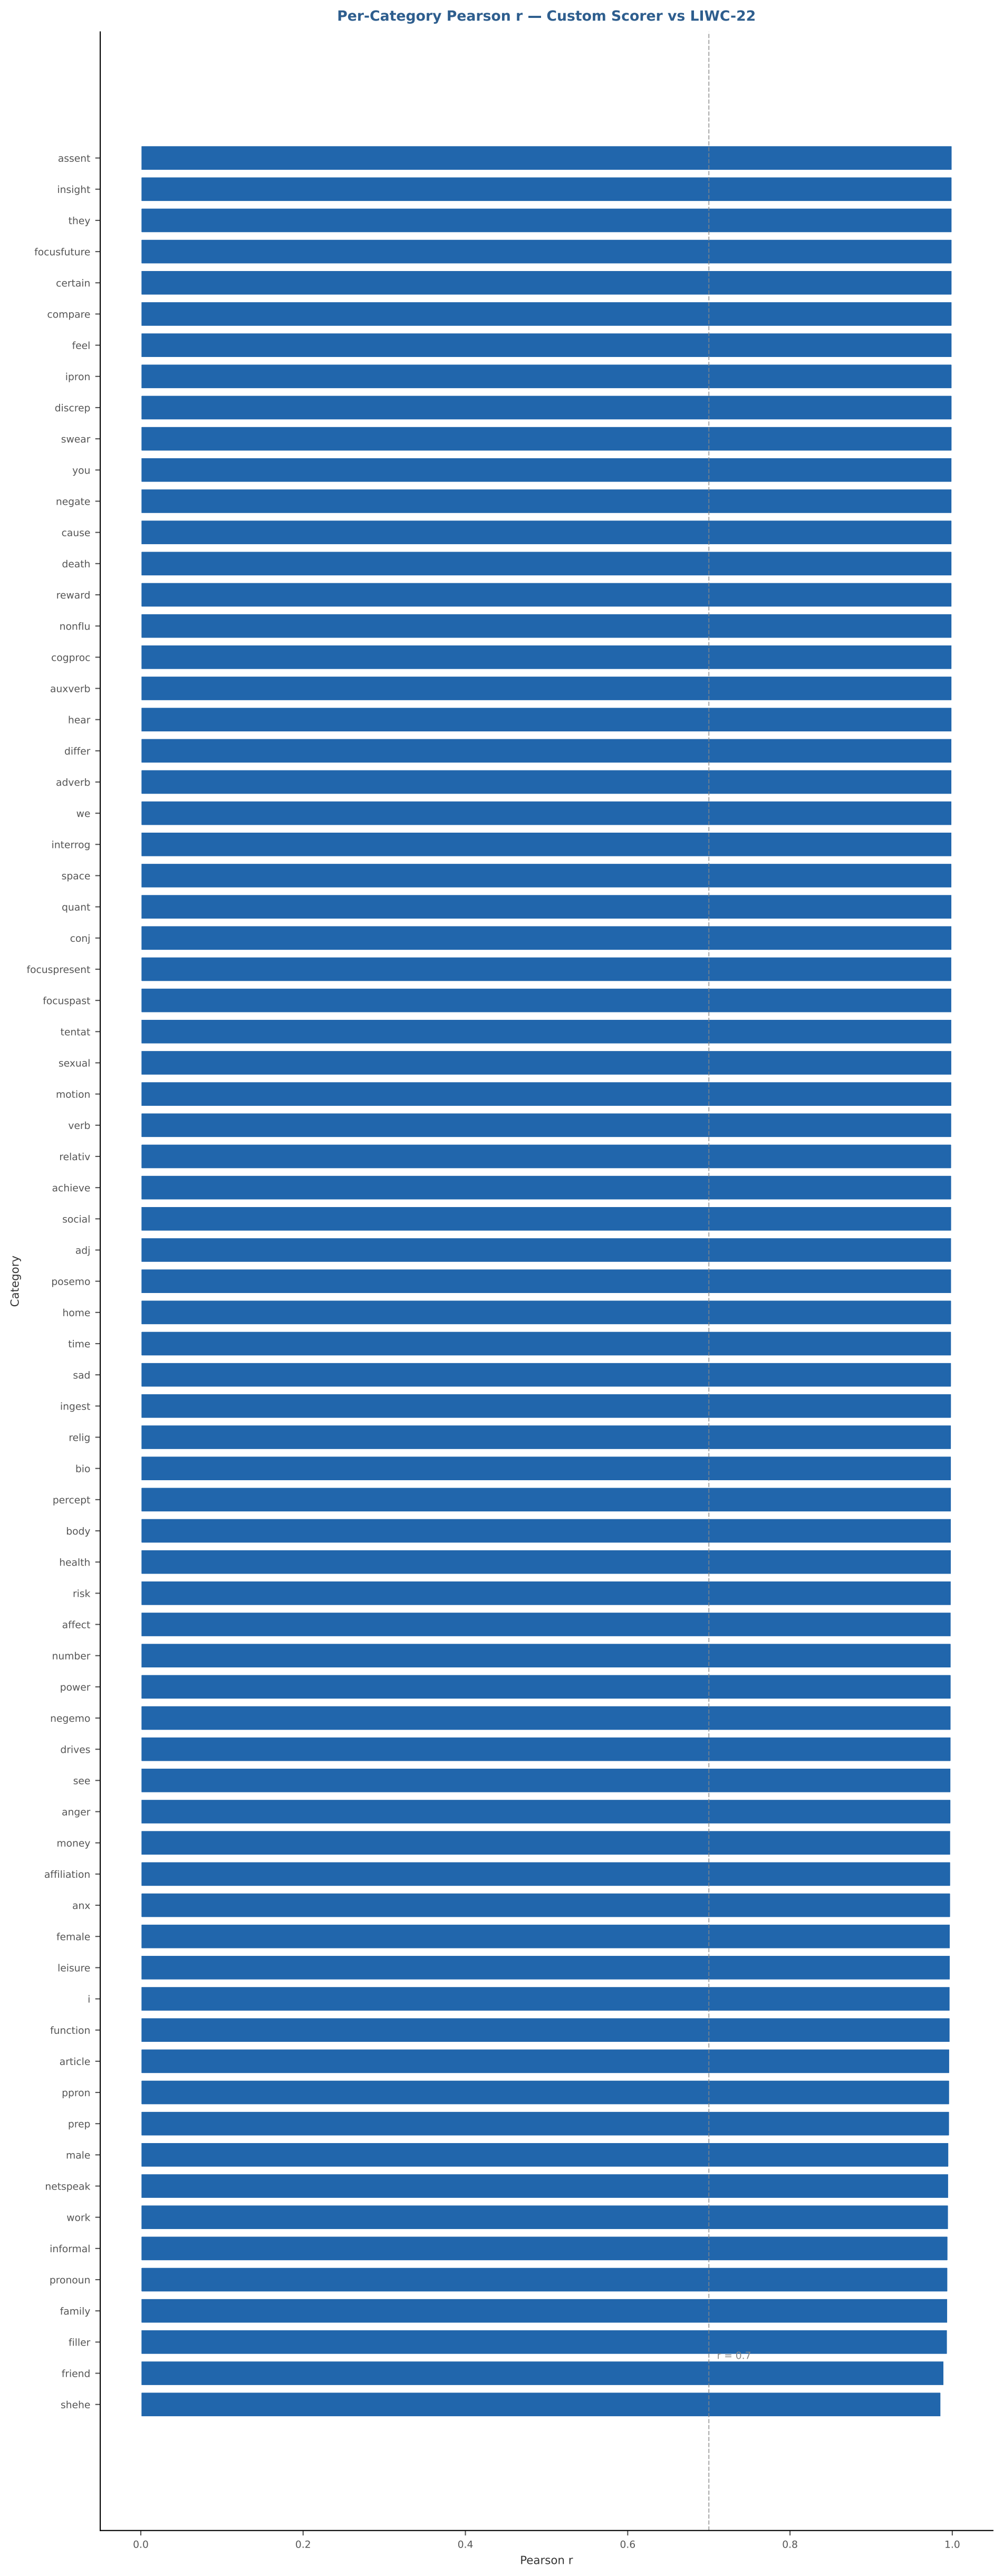

Dataset: New Data Only

Section 1 — Scoring Agreement

Per-Category Scoring Agreement (sorted by MAE descending)
MAE = mean absolute difference in percentage points; yellow = MAE > 2 pp

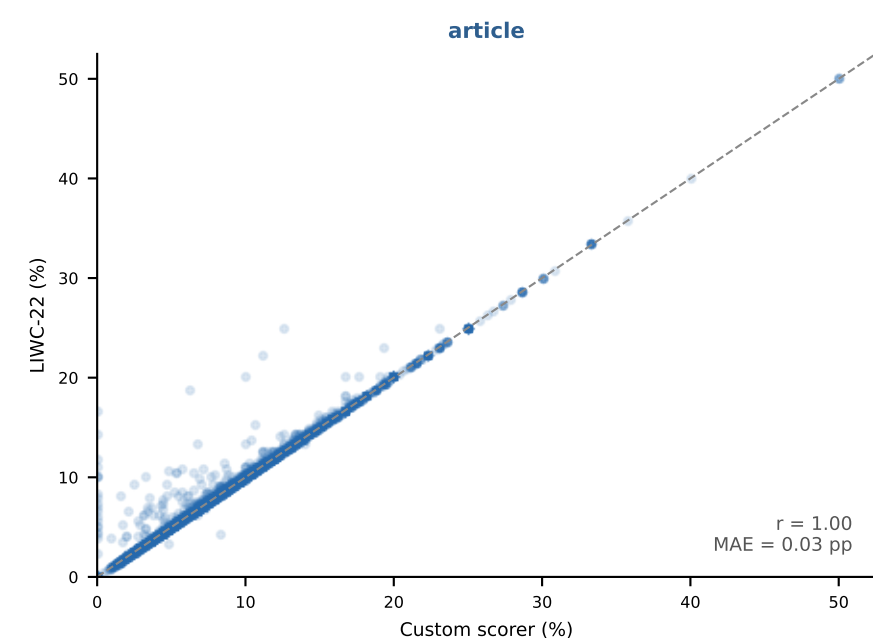

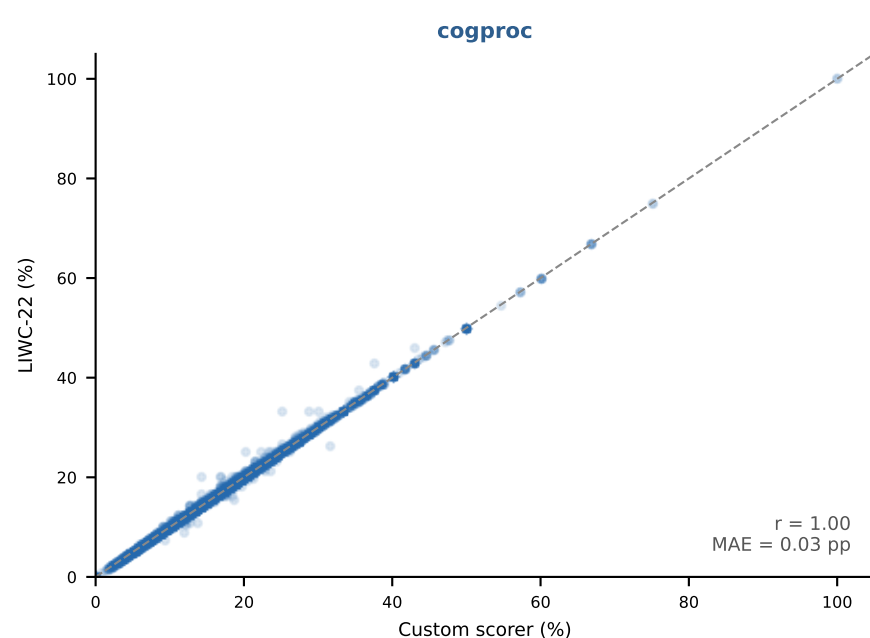

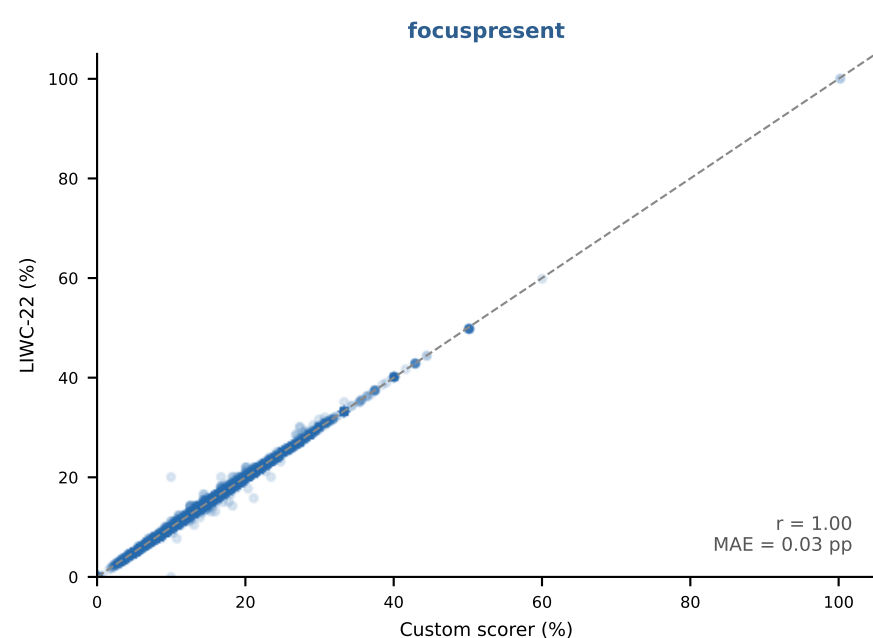

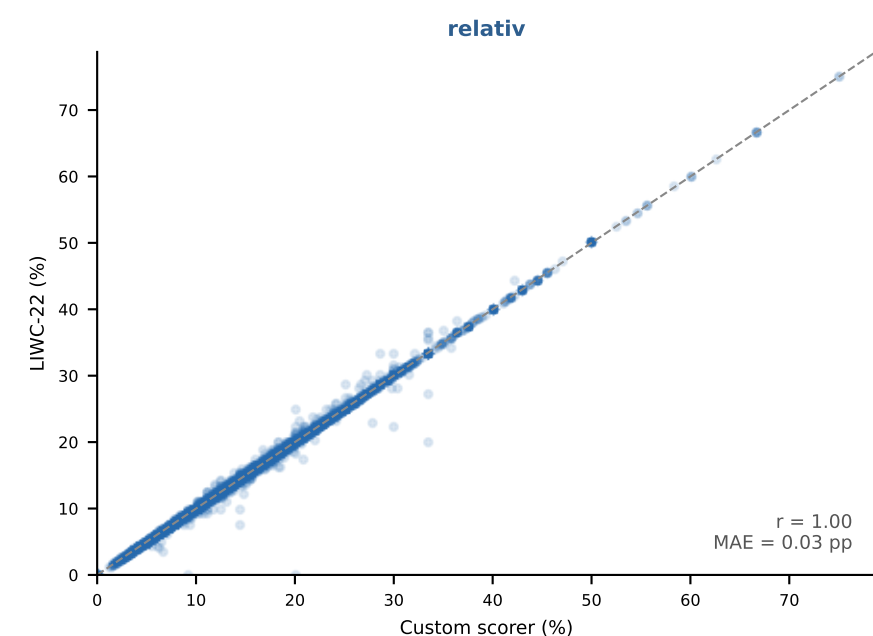

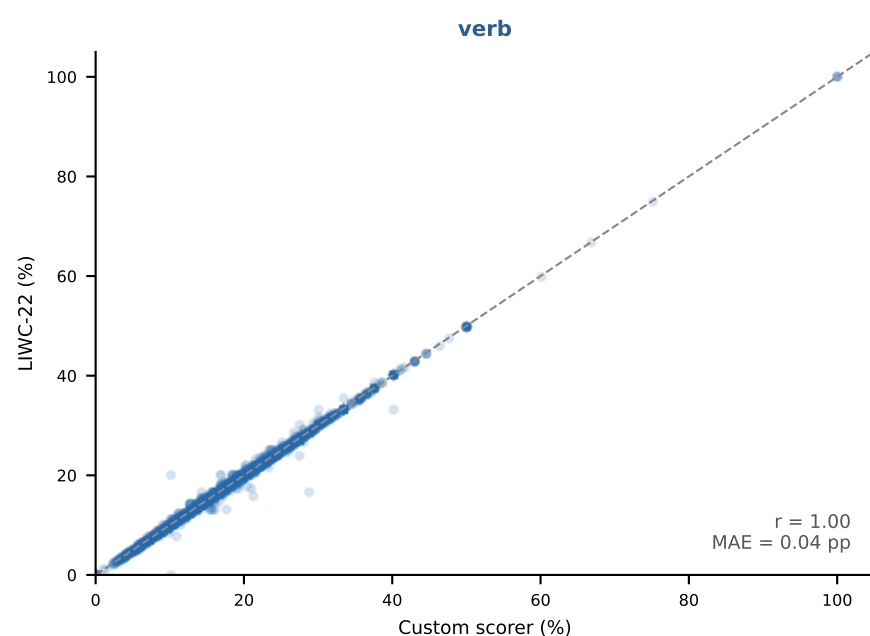

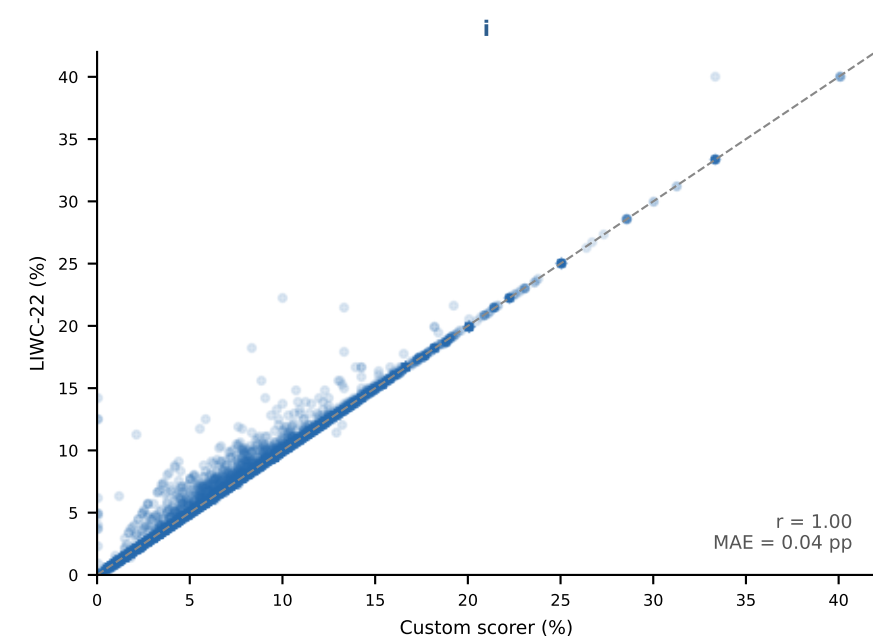

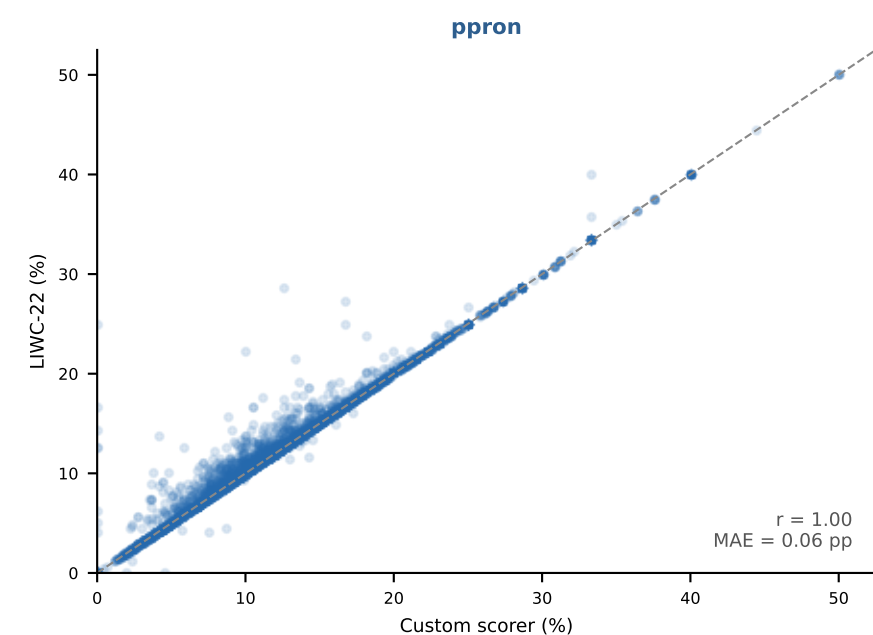

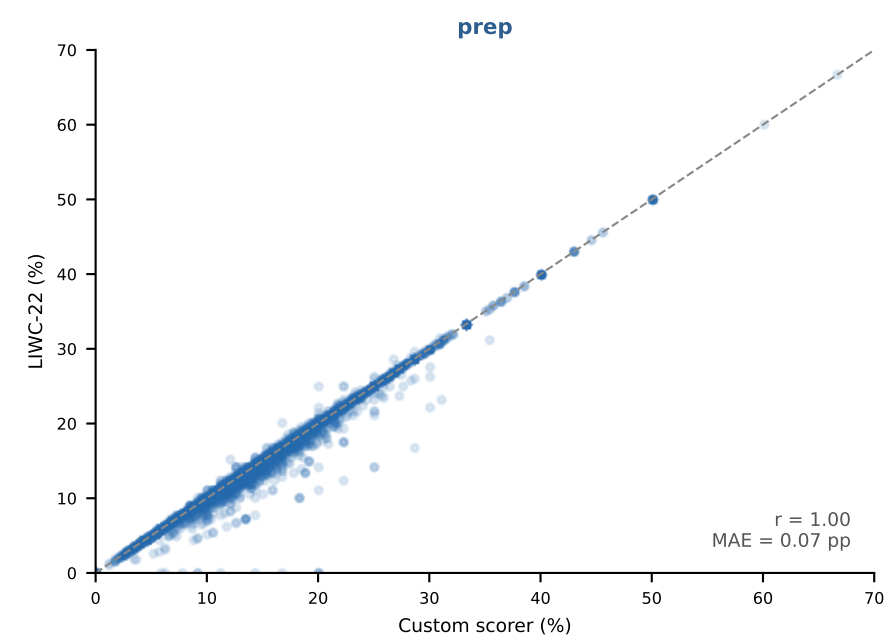

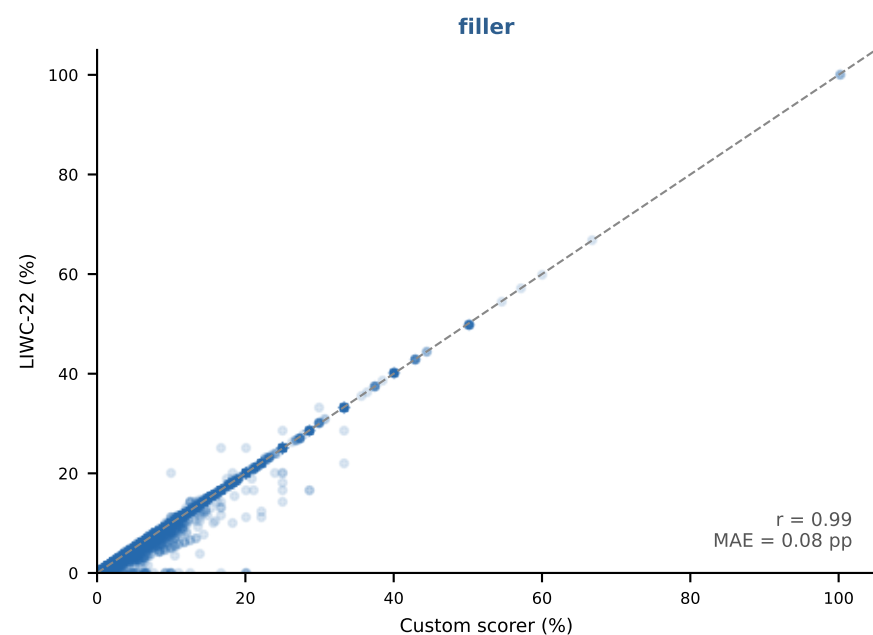

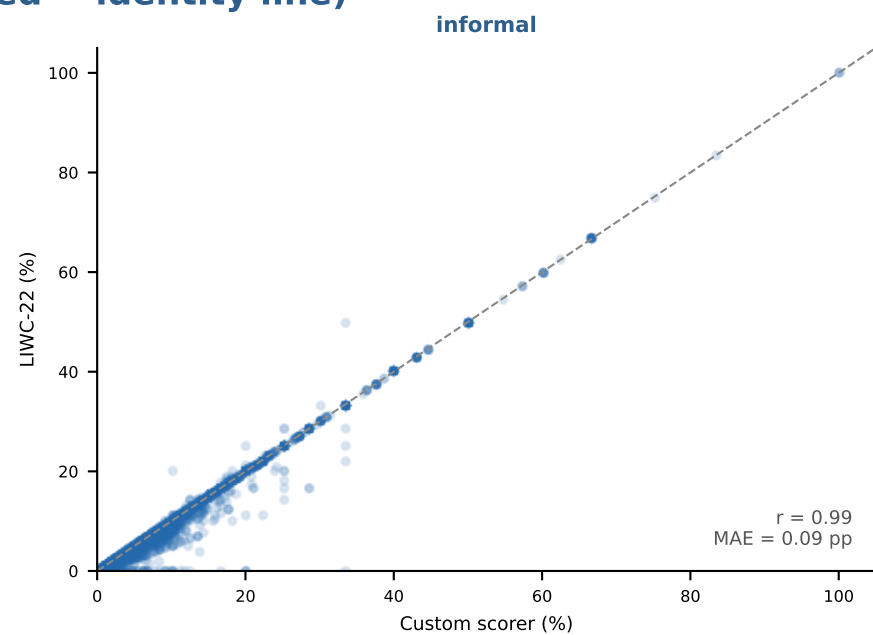

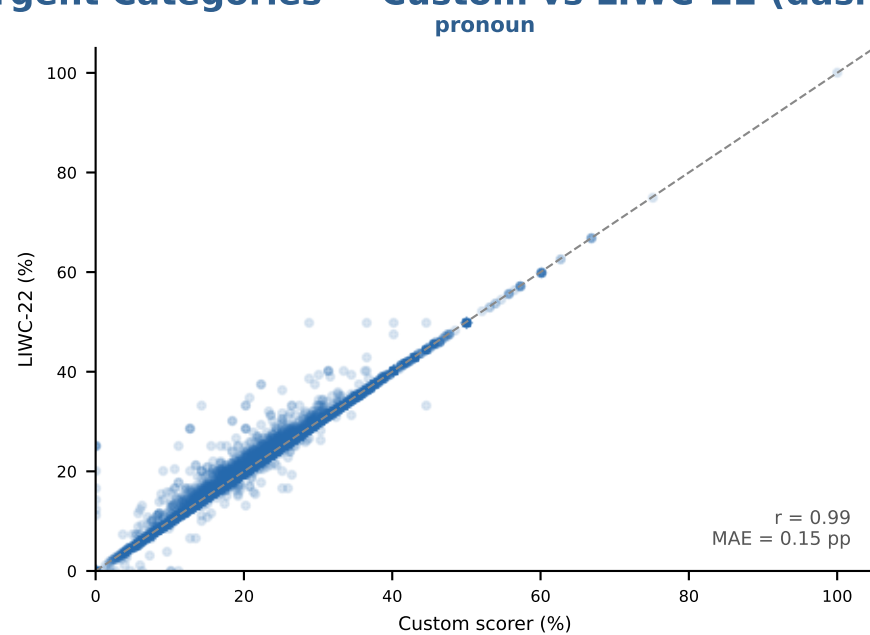

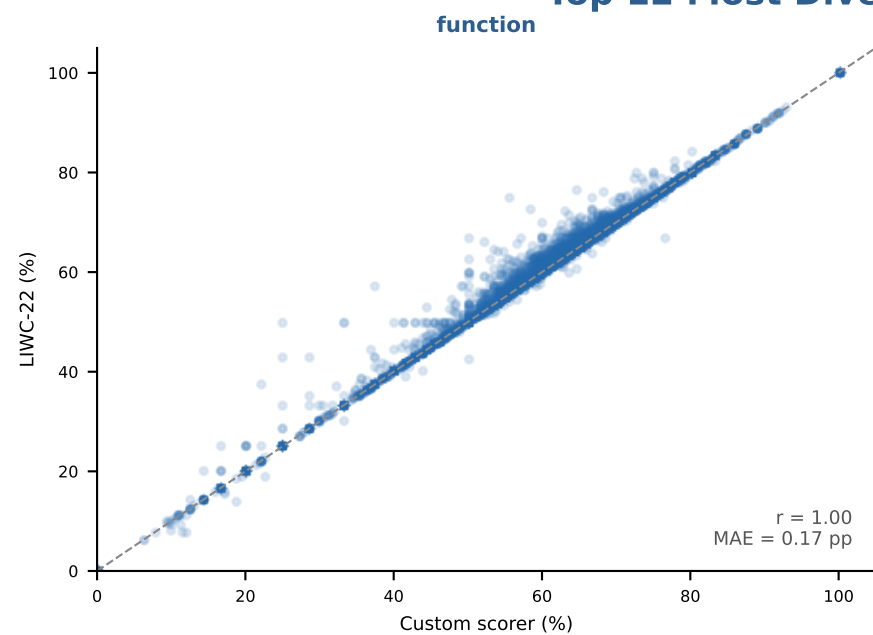

Category	Pearson r	p-value	MAE (pp)	Mean (custom)	Mean (LIWC-22)

Per-Category Pearson r — Custom Scorer vs LIWC-22

Section 2 — Divergence Analysis

Top 12 Most Divergent Categories — Custom vs LIWC-22 (dashed = identity line)

Section 3 — LIWC-22 Summary Variables

LIWC-22 Summary Variables — Not Available with External Dictionary

The four LIWC-22 summary variables are not available in this run:

Analytic · Clout · Authentic · Tone

These scores are computed by LIWC-22 from a proprietary regression model trained on the built-in English dictionary. They do not generalise to external dictionary files, so LIWC-22 omits them when a .dicx file is supplied (as here, with the Dutch LIWC-2015 dictionary).

To obtain these variables you would need to run LIWC-22 with its built-in English dictionary (-d LIWC22), which is not appropriate for Dutch text.

See docs/statistical_decisions.md §5 for context.

Section 4 — Category Coverage Differences

Category Coverage Differences

(custom-only includes fps_dutch fallback; LIWC-22-only includes structural metrics like WC, Emoji, AllPunc)

Custom scorer only	LIWC-22 only
—	—

Section 5 — Diagnostics

Tokenisation Sanity Check — Word Count Agreement (custom scorer re.findall vs LIWC-22 WC; dashed = identity)
